EE 313 Signals and Systems Exam 1 Example

Name _____

Instructions: Show all work for full credit. Write answers in indicated places. Attach equation sheet to exam.

1) Using the forward-difference approximation, discretize the differential equation $\frac{d^2 y(t)}{dt^2} + 3 y(t) = 0.5 \frac{d x(t)}{dt} + 8 x(t) \text{ given that } y(0) = 2 \text{ and } \frac{d y(t)}{dt}\Big|_{t=0} = 20 \text{ for a sampling period of } T = 0.5 \frac{d x(t)}{dt} + 8 x(t) \text{ given that } y(0) = 2 \text{ and } \frac{d y(t)}{dt}\Big|_{t=0} = 20 \text{ for a sampling period of } T = 0.5 \frac{d x(t)}{dt} + 8 x(t) \text{ given that } y(0) = 2 \text{ and } \frac{d y(t)}{dt}\Big|_{t=0} = 20 \text{ for a sampling period of } T = 0.5 \frac{d x(t)}{dt} + 8 x(t) \text{ given that } y(0) = 2 \text{ and } \frac{d y(t)}{dt}\Big|_{t=0} = 20 \text{ for a sampling period of } T = 0.5 \frac{d x(t)}{dt} + 8 x(t) \text{ given that } y(0) = 2 \text{ and } \frac{d y(t)}{dt}\Big|_{t=0} = 0.5 \frac{d x(t)}{dt} + 8 x(t) \text{ given that } y(0) = 0.5 \frac{d$

0.24 s for $t \ge 0$. Put the resulting difference equation in the form $y[n] = -\sum_{i=1}^{N} a_i y[n-i] + \sum_{i=0}^{M} b_i x[n-i]$

and give the range of the index n for which it is valid. What is the order of the difference equation? What are the initial conditions y[0] and y[1]?

 $y[n] = \underline{2y[n-1] - 1.1728y[n-2] + 0.12x[n-1] + 0.3408x[n-2] \quad n \ge 2}_{n \ge 2}$

Order = 2 y[0] = 2 y[1] = 6.8

2) Answer/solve the following questions.

a) Given
$$v(t) = -2u(t+2) + 4u(t-4) - 2u(t-6)$$
, plot $v(t)$.

b) Express the waveform y(t) shown in terms of unit step functions and ramp functions.

$$y(t) = __{u(t+3) - u(t) + r(t) - r(t-2)}$$

- c) Given $x_1(t) = 12\cos(4\pi t)$ and $x_2(t) = 8\cos(0.2\pi t)$ is the sum $x_1(t) + x_2(t)$ periodic? Yes / No Why or why not?
- d) Is the function $w[n] = 5\cos(4n \pi/2)$ periodic? Yes / No

Why or why not?

3) The signal x(t) = -2u(t-2) is input into a system containing no initial energy which is characterized by the impulse response $h(t) = 3e^{-0.5(t-1)}u(t-1)$. Accurately sketch x(t) and h(t) on the axes below. Then, calculate and accurately sketch the system output y(t).

3) cont.

$$y(t) = \begin{cases} 0 & t < 3 \text{ s} \\ -12[1 - e^{-0.5(t-3)}] & t \ge 3 \text{ s} \end{cases}$$
