Quiz 6 (Spring 2024)

Name Key A

Instructions: Open book & notes. Place answers in indicated spaces. Show **all** work. Use 4-5 significant figures.

At 300 K, a section of gallium arsenide has been uniformly doped exclusively with acceptor atoms to a concentration of $5 \times 10^{13} \text{ #/cm}^3$. First, find the majority & minority carrier concentrations (#/cm^3), majority & minority carrier mobilities ($\text{cm}^2/\text{V}\cdot\text{s}$), and majority & minority diffusion coefficients (cm^2/s). Then, determine the ambipolar carrier mobility ($\text{cm}^2/\text{V}\cdot\text{s}$) and diffusion coefficient (cm^2/s).

$$N_a = 5 \times 10^{13} \text{ #/cm}^3 \quad \text{From Table B.4, } n_i = 1.8 \times 10^6 \text{ #/cm}^3 \\ \text{@ 300K for GaAs}$$

$$\text{majority carriers} = p_0 \approx N_a = \underline{5 \times 10^{13} \text{ #/cm}^3} \quad (\text{can confirm w (4.62)})$$

$$(4.43) \quad n_0 p_0 = n_i^2 \Rightarrow n_0 = \frac{(1.8 \times 10^6)^2}{5 \times 10^{13}} = \underline{0.0648 \text{ #/cm}^3} \\ \text{minority carriers}$$

As $N_a = 5 \times 10^{13} \text{ #/cm}^3 < 10^{14} \text{ cm}^{-3}$ on graph, use

Table S.1 to get $\underline{\mu_n = 8500 \text{ cm}^2/\text{V}\cdot\text{s}}$ (minority)

$\underline{\mu_p = 400 \text{ cm}^2/\text{V}\cdot\text{s}}$ (majority)

Per Einstein relation (5.47)

$$\frac{D_n}{\mu_n} = \frac{D_p}{\mu_p} = \frac{k_B T}{e} = \frac{(8.617333 \times 10^{-5} \text{ eV/K}) 300\text{K}}{e} = 0.025852 \text{ V}$$

$$D_n = 8500(0.025852) = \underline{219.742 \text{ cm}^2/\text{s}} \quad (\text{minority})$$

$$D_p = 400(0.025852) = \underline{10.3408 \text{ cm}^2/\text{s}} \quad (\text{majority})$$

Since $p_0 \gg n_0$ (p-type)

$$(6.45) \quad \underline{D' = D_n = 219.742 \text{ cm}^2/\text{s}} \quad \& \quad (6.46) \quad \underline{\mu' = \mu_n = 8500 \text{ cm}^2/\text{V}\cdot\text{s}}$$

$\rho_0 =$ majority carrier conc. = $5 \times 10^{13} \text{ \# / cm}^3$

$n_0 =$ minority carrier conc. = 0.0648 \# / cm^3

majority carrier mobility = $\mu_p = 400 \text{ cm}^2/\text{V-s}$

minority carrier mobility = $\mu_n = 8500 \text{ cm}^2/\text{V-s}$

majority diffusion coeff. = $D_p = 10.341 \text{ cm}^2/\text{s}$

minority diffusion coeff. = $D_n = 219.742 \text{ cm}^2/\text{s}$

ambipolar carrier mobility = $\mu' = 8500 \text{ cm}^2/\text{s}$

ambipolar diffusion coeff. = $D' = 219.742 \text{ cm}^2/\text{s}$

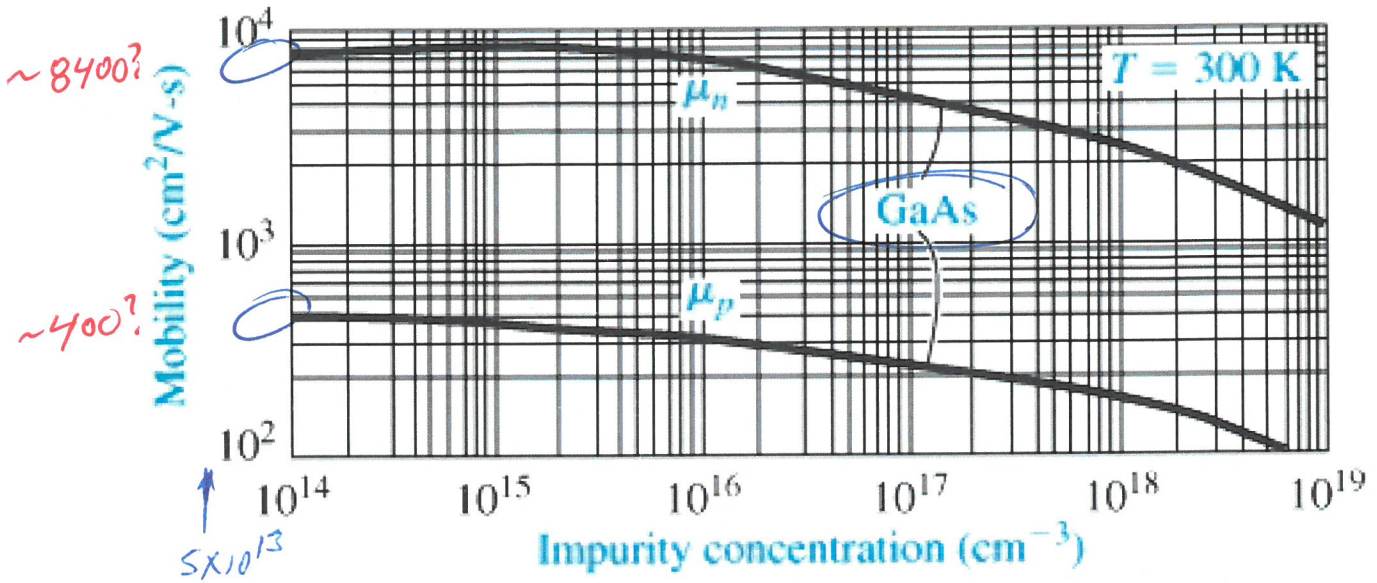

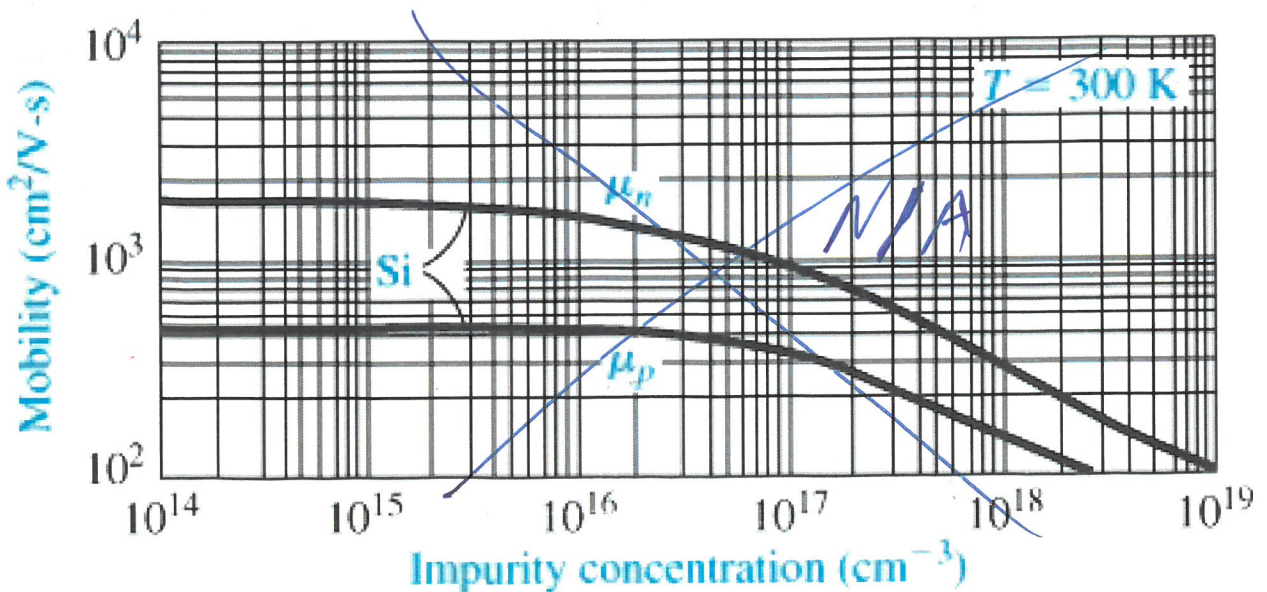

Table 5.1 | Typical mobility values at $T = 300 \text{ K}$ and low doping concentrations

	μ_n (cm ² /V-s)	μ_p (cm ² /V-s)
Silicon	1350	480
Gallium arsenide	8500	400
Germanium	3900	1900

Quiz 6 (Spring 2024)

Name Key C

Instructions: Open book & notes. Place answers in indicated spaces. Show **all** work. Use 4-5 significant figures.

At 300 K, a section of silicon has been uniformly doped exclusively with donor atoms to a concentration of $2 \times 10^{14} \text{ #/cm}^3$. First, find the majority & minority carrier concentrations (#/cm^3), majority & minority carrier mobilities ($\text{cm}^2/\text{V}\cdot\text{s}$), and majority & minority diffusion coefficients (cm^2/s). Then, determine the ambipolar carrier mobility ($\text{cm}^2/\text{V}\cdot\text{s}$) and diffusion coefficient (cm^2/s).

$$N_d = 2 \times 10^{14} \text{ #/cm}^3 \quad \text{From Table B.4, } n_i = 1.5 \times 10^{10} \text{ #/cm}^3 \\ \text{@ 300 K for Si}$$

$$\text{majority carriers} = n_0 = N_d = \underline{2 \times 10^{14} \text{ #/cm}^3} \quad \text{can confirm w/ (4.60)}$$

$$(4.43) \quad n_0 p_0 = n_i^2 \Rightarrow p_0 = \frac{(1.5 \times 10^{10})^2}{2 \times 10^{14}} = \underline{1.125 \times 10^6 \text{ #/cm}^3} \\ \text{minority carriers}$$

Use either Si graph or Table S.1 to get

$$\text{mobilities} \quad \underline{\mu_n = 1350 \text{ cm}^2/\text{V}\cdot\text{s}} \quad (\text{majority})$$

$$\underline{\mu_p = 480 \text{ cm}^2/\text{V}\cdot\text{s}} \quad (\text{minority})$$

Per Einstein relation (5.47)

$$\frac{D_n}{\mu_n} = \frac{D_p}{\mu_p} = \frac{k_B T}{e} = 8.617333 \times 10^{-5} (300) = 0.025852 \text{ V}$$

$$D_n = 1350 (0.025852) = \underline{34.9002 \text{ cm}^2/\text{s}} \quad (\text{majority})$$

$$D_p = 480 (0.025852) = \underline{12.40896 \text{ cm}^2/\text{s}} \quad (\text{minority})$$

Since $n_0 \gg p_0$ (n-type)

$$(6.47) \quad D' = D_p = \underline{12.409 \frac{\text{cm}^2}{\text{s}}} \quad \text{and (6.48)} \quad \mu' = -\mu_p = -480 \frac{\text{cm}^2}{\text{V}\cdot\text{s}}$$

$n_0 = \text{majority carrier conc.} = 2 \times 10^{14} \text{ \# / cm}^3$

$p_0 = \text{minority carrier conc.} = 1.125 \times 10^6 \text{ \# / cm}^3$

majority carrier mobility = $\mu_n = 1350 \text{ cm}^2/\text{V}\cdot\text{s}$

minority carrier mobility = $\mu_p = 480 \text{ cm}^2/\text{V}\cdot\text{s}$

majority diffusion coeff. = $D_n = 34.9 \text{ cm}^2/\text{s}$

minority diffusion coeff. = $D_p = 12.409 \text{ cm}^2/\text{s}$

$\mu' = \text{ambipolar carrier mobility} = 480 \text{ cm}^2/\text{V}\cdot\text{s}$

$D' = \text{ambipolar diffusion coeff.} = 12.409 \text{ cm}^2/\text{s}$

Table 5.1 | Typical mobility values at $T = 300 \text{ K}$ and low doping concentrations

	$\mu_n \text{ (cm}^2/\text{V}\cdot\text{s)}$	$\mu_p \text{ (cm}^2/\text{V}\cdot\text{s)}$
