

- 1) A two-wire transmission line consists of two perfectly-conducting wires of diameter 2 mm with a center-to-center spacing of 5 mm. If the insulation had an effective dielectric permittivity of  $2.2\epsilon_0$ , find  $L$ ,  $C$ ,  $Z_0$ , and the phase velocity. At a frequency of 890 MHz, what are the phase constant and wavelength?

From Table 11.1,

$$L = \frac{\mu_0}{\pi} \cosh^{-1}\left(\frac{d}{2z_a}\right)$$

$$C = \frac{\pi \epsilon}{\cosh^{-1}\left(\frac{d}{2z_a}\right)}$$

$$L = \frac{\mu_0}{\pi} \cosh^{-1}\left(\frac{5 \text{ mm}}{2 \text{ mm}}\right) = \frac{4\pi \times 10^{-7}}{\pi} \cosh^{-1}(2.5)$$

$$\underline{L = 6.267 \times 10^{-7} \text{ H/m} = 626.7 \text{ nH/m}}$$

$$C = \frac{\pi (2.2) 8.854 \times 10^{-12}}{\cosh^{-1}(2.5)}$$

$$\underline{C = 3.906 \times 10^{-11} \text{ F/m} = 39.057 \text{ pF/m}}$$

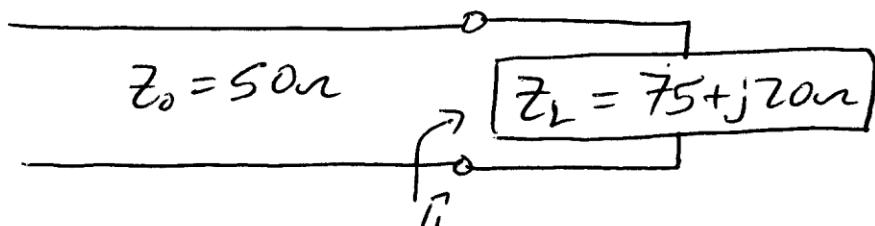

$$(11.21c) \quad Z_0 = \sqrt{LC} = \sqrt{\frac{6.267 \times 10^{-7}}{3.906 \times 10^{-11}}} = \underline{126.67 \text{ }\Omega}$$

$$(11.21b) \quad u = \frac{1}{\sqrt{LC}} = \frac{1}{\sqrt{6.267 \times 10^{-7} (3.906 \times 10^{-11})}} = \underline{2.021 \times 10^8 \text{ m/s}}$$

$$(11.21b) \quad \beta = \omega/u = \frac{2\pi (890 \times 10^6)}{2.021 \times 10^8} = \underline{27.67 \text{ rad/m}}$$

$$(11.13) \text{ or } (11.14) \quad \lambda = \frac{u}{\beta} = \frac{2\pi}{\beta} = \frac{2\pi}{27.67} = \underline{0.2271 \text{ m}}$$

11.14 A  $50\Omega$  coaxial cable feeds a  $75+j20\Omega$  dipole antenna. Find  $\Gamma$  and  $S$ .

Assume coaxial cable is lossless (SWR or VSWR doesn't make much sense for lossy trans. lines)

$$(11.36) \quad \Gamma_L = \Gamma = \frac{Z_L - Z_0}{Z_L + Z_0} = \frac{(75+j20) - 50}{(75+j20) + 50}$$

$$\underline{\underline{\Gamma_L = 0.2529 / 29.57^\circ}}$$

$$\underline{\underline{|\Gamma| = |\Gamma_L| = 0.2529}}$$

$$(11.38) \quad S = \frac{1 + |\Gamma_L|}{1 - |\Gamma_L|} = \frac{1 + 0.2529}{1 - 0.2529}$$

$$\underline{\underline{S = 1.677}}$$
